

Certain Advantage says...

USE **70%** LESS  
IMPRESSION MATERIAL  
AND STILL MAKE A GREAT  
BRIDGE OR CROWN.

# INTRODUCING ADVANTAGE ThermTray1 (Quadrant)

Thin notched end-bar will not spring back

**Shaped for savings.** You'll use up to 70% less impression material with Advantage Dental's ThermTray1 closed-bite custom trays. In fact, the quadrant version requires only 17 ml of impression material. Think of the savings per impression! Think of the savings per year.

And Advantage ThermTray1 delivers the strength of steel with the disposability of plastic. Plus, it guarantees a pre-indexed guide to the correct centric bite for superior clinical results.

**Saves you time in any shape or form.** Thanks to the unique thermoplastic bite wafer in every Advantage ThermTray1 (quadrant,  $\frac{3}{4}$ -arch or anterior) you'll save valuable time. It accurately records the teeth opposing the crown or bridge to be made. So when removed from the patient's mouth, the tray's impression is totally stable—without distortion or spring back. The thermal plastic bite wafer thus eliminates remakes and adjustments, saving valuable chair time.

INTRODUCING

ADVANTAGE  
**ThermTray1**  
(3/4 Arch)

*Thin end-bar is notched to avoid spring back rebound*

**Ideal for difficult restorations.** When challenged by larger arches or the presence of third-molar interference, the 3/4-arch tray will save you money, time and grief. Like the “quad,” it provides the same stability and occluded registration for multiple crowns or a bridge. Also, as with the quad, the end-bar may be snipped off when posterior interference exists.

 **AdvantageDental Products, Inc.**

# ADVANTAGE ThermTray1 (Anterior)

**Same principle. Same savings.** The anterior version of Advantage ThermTray1 features the same function, technique and benefits as the quadrant and  $\frac{3}{4}$ -arch trays. ThermTray1 is the most accurate, cost-effective, time-efficient and patient friendly tray system on the market today.
